

Visual Scene Displays (Non-powered AAC)

Visual Scene Displays (VSD) use photographs of experiences/situations to provide context for early communicators

VSDs can be used as part of a high tech AAC device, or can be a printed out picture with symbols to facilitate conversation around the outside

Example...

	 sharks	
	 aquarium	
 Daddy	 Ava	 fun

VSDs help with both expressing and understanding language. They make conversations more concrete and meaningful, which aids in language processing.

 So much fun!	 sliding fast	 Be carefull!
 friends	 park	 it's noisy

When using VSDs a partner should support the conversation by speaking and interpreting what the individual points to.

They should also verbalise and expand on what the person is indicating on the scene.
